SUMMARY

Senior Full-Stack Engineer with 5 years building and running production web products in TypeScript, React/Next.js, Node.js, PostgreSQL and MongoDB. Founding engineer at Naya Studio, owning architecture, frontend performance (page loads cut from 2.5s to under 1s), and DevOps on GCP with Docker and staged CI/CD; also shipped LLM features that cut project configuration from about 3 hours to under 10 minutes. Previously co-founder and CTO of a trading SaaS with 2,000+ users. Experienced with multi-tenant SaaS on PostgreSQL row-level security, real-time collaboration, and cross-platform mobile. Working remotely since 2022: async-first, write design docs, available for 4+ hours of US/EU overlap.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, Dart
Frontend: React, Next.js, Redux, Three.js (Drei), Yjs, Flutter
Backend: Node.js, Express, REST APIs, WebSockets (Socket.io), RabbitMQ
Databases: PostgreSQL, MongoDB, Elasticsearch, Redis, Supabase, Firebase
Cloud & DevOps: Google Cloud Platform (Cloud Run), Docker, GitHub Actions CI/CD, Git
Testing & Observability: Playwright (end-to-end), Sentry
AI & LLM: LLM structured extraction, prompt engineering, provider fallback, YOLO object detection
AI-Assisted Development: Claude Code, Cursor, Codex

EXPERIENCE

Naya Studio Remote
Senior Software Engineer (Full Stack & DevOps) *Apr. 2025 – Present*
Software Engineer *Dec. 2022 – Apr. 2025*
Early-stage startup building AI-powered cost estimation and collaborative design tools for enterprise clients in construction and manufacturing. Next.js, React, Node.js, MongoDB, GCP.

- Founding engineer working directly with the CEO and CTO; owned architecture decisions and technical direction from the ground up, mentored colleagues on design and implementation, and interviewed engineering candidates.
- Led frontend performance optimization in Next.js and React: list virtualization, memoized components and functions, profiling and eliminating unnecessary re-renders, caching and code-splitting; cut page load time from 2.5s to under 1s, Largest Contentful Paint by about 55% and Time to Interactive by about 45%.
- Wrapped critical React components in Sentry error boundaries so a failure in one area is contained and reported instead of crashing the whole app, keeping the rest of the product usable.
- Built core collaboration features: real-time collaboration across the entire project with Yjs, comments on video, text, canvas and 3D models, a 3D model viewer in Three.js and Drei with spatial annotations, and nested folder uploads of 1,000+ files and 5 GB without blocking the UI.
- Rebuilt the undo/redo system as a generic engine that any feature in the app can adopt with minimal code.
- Owned DevOps on Google Cloud Platform: containerized Node.js services with Docker and built GitHub Actions pipelines with staged staging and production deploys to Cloud Run.
- Supported SOC 2 and CASA compliance: remediated security-scan findings, implemented auditor-recommended hardening on GCP, and prepared audit evidence.
- Built an estimation engine that reads project hardware specs, matches each item to price books, and configures its options automatically with confidence scoring, retry and fallback, flagging uncertain items for human review; cut configuration of a typical project from about 3 hours of manual entry in Avaware to 5–10 minutes.
- Architected a catalog extraction platform (Gemini and Claude behind a swappable provider interface) that converts hardware-catalog PDFs into versioned product databases in MongoDB with human-in-the-loop review; extracted 65 manufacturer catalogs at about 95% field-level accuracy, validated by comparing output against Avaware's product database.
- Curated an 800 MB dataset of architectural plan images and trained a YOLO object detection model in Python to identify doors in plans.

The Hub India
Software Engineer *Sep. 2022 – Dec. 2022*

- Built web scrapers in JavaScript (Puppeteer) and Python (BeautifulSoup) that extracted data from regulatory websites worldwide into Elasticsearch, with extraction jobs queued through RabbitMQ and Redis.
- Wrote custom extractors for non-standard sites, turning pages sourced by the analyst team into structured, searchable records.

Wipro Technologies Bengaluru, India
Project Engineer (Full Stack) *Oct. 2021 – Sep. 2022*

- Maintained and extended enterprise e-commerce storefronts on Salesforce Commerce Cloud using Node.js, resolving 15+ production bugs across order processing and customer-facing UI.
- Built scheduled background jobs (cron) to run backend data processing reliably off the request path.

FOUNDER VENTURES (BUILT ALONGSIDE FULL-TIME ROLE)

Tankersathi Bengaluru, India
Founder & Sole Engineer *Jul. 2026 – Present*
Multi-tenant SaaS running daily operations for water-tanker delivery businesses: orders, customers, staff, expenses, payments and bookings. In Google Play closed testing. Flutter, Supabase, PostgreSQL, TypeScript, Edge Functions, WhatsApp Cloud API.

- Architected a three-client platform (Flutter owner app, Flutter customer app for Android and iOS, and a PWA booking site) on one Supabase backend, with business logic in Postgres RPCs and TypeScript Edge Functions as a single source of truth.
- Enforced multi-tenant isolation with PostgreSQL row-level security across owner, manager and driver roles; evolved the schema through 60+ versioned migrations, each checked against a repeatable RLS isolation test.
- Built passwordless WhatsApp one-time-code sign-in via a Supabase Auth hook, and an event-driven notification pipeline (Postgres triggers, signed webhooks, Edge Functions, FCM) with WhatsApp fallback, rate-limited under Meta's daily quota.
- Designed for field conditions: offline read cache, English and Kannada localization, zero-fee UPI QR payments settling directly to the supplier's bank, and Android call-screening that prompts order capture without restricted call-log permissions.
- Ran it as a one-person product team: a design spec and implementation plan per feature, 300+ automated tests, backend-controlled in-app and forced updates, and releases driven by feedback from real operators.

Kramatiq Bengaluru, India
Co-founder & CTO *Mar. 2025 – Jun. 2026*
Algorithmic trading SaaS for MetaTrader 5 users. Next.js, Node.js, Supabase, PostgreSQL, MQL5.

- Co-founded the company and led engineering as CTO, managing two engineers; grew the platform to 2,000+ registered users and 300+ monthly paying subscribers.
- Architected a multi-tenant SaaS for multi-user strategy deployment, real-time portfolio analytics, and automated multi-account risk controls.
- Designed the PostgreSQL schema on Supabase for high-frequency trade-history logs, profit-and-loss analytics, and multi-tenant data separation.
- Built low-latency sync pipelines between MetaTrader 5 terminals and web dashboards, and developed the trading algorithms in MQL5.
- Automated operations end to end: user onboarding, subscription management, and transactional email.

EDUCATION

Sapthagiri College of Engineering Bengaluru, India
Bachelor of Engineering in Electrical and Electronics Engineering *2017 – 2021*
